

## **Peugeot 206**

### **All models from 09.2001 – 07.2002**

#### **Fuel gauge shows incorrect reading.**

If there are complaints with these vehicles that the fuel gauge indicates that the tank is still  $\frac{1}{4}$  full even though it is actually empty, one possible cause is incorrect data exchange between the instruments and the engine control unit. In this case, the fuel level warning light does not light up either. The fault often occurs in vehicles which only drive short distances with many stops. To eliminate the fault, an updated software version has to be installed on the engine control unit. The software version should be 27 or higher. The current software version can be read out of the control unit using a suitable diagnosis unit.
