

Plastic-lenses with clear-glass optic

Use of concentrated cleaning agents and antifreezes in headlamp washer systems.

With the use of concentrated cleaning agents and antifreezes, particular attention has to be paid to the suitability of these for use with plastic lenses with clear-glass optic. Otherwise it can quickly lead to stress fractures in the material. Because of this the lenses become clouded and must be replaced. This often requires a complete exchange of the headlamps.

When cleaning by hand do not use rough sponges, this will lead to scratches on the surface.
